

THE INVENTION CLAIMED IS:

1. A kit, comprising:
a blister tray having a first medical device contained therein;
and a package sized and shaped to contain a second medical device and insertable within said blister tray, a portion of said package engageable with said first medical device such that said first medical device inhibits the removal of said package.
2. The kit of Claim 1, wherein said portion of said package includes a pair of flaps engageable with said first medical device.
3. The kit of Claim 2, wherein said first medical device and said second medical device are aligned in said blister tray such that said first medical device is positioned substantially perpendicular to said second medical device contained by said package.
4. The kit of Claim 3, wherein said first medical device and said second medical device are aligned in said blister tray such that a portion of said second medical device is positioned under said first medical device.
5. The kit of Claim 4, wherein said second medical device includes a tip, said portion of said second medical device includes said tip.

6. The kit of Claim 5, wherein said package includes a holding area sized and shaped to allow removal of said package from said blister tray.

7. The kit of Claim 6, wherein said package is aligned in said blister tray such that said first medical device is positioned between said flaps and said holding area.

8. The kit of Claim 1, further comprising a blister card sized and shaped to be inserted within said blister tray, said blister card including indicia printed thereon relating to said first medical device.

9. A package made from a planar sheet, comprising:
a first foldable panel including a first fold line and a second fold line positioned on one side of said first fold line, a main section positioned on an opposite side of said first fold line, and a center section positioned between said first fold line and said second fold line, said main section having a first slit that forms a retaining portion moveable such that said retaining portion extends outwardly from said main section so as to create a first opening in said first panel, and a second slit that forms a first base moveable such that said first base extends outwardly from one side of said first panel so as to create a second opening therein, said center section having a third slit that forms a second base moveable such that said second base extends outwardly from said one side of said first panel so as to create a third opening therein, said first opening and said

second opening being aligned with each other when said first panel is folded about said first fold line such that said first base is adjacent to said second base, and said third opening cooperating with said first and second openings, when they are aligned with each other, to form a receptacle for a medical device.

10. The package of Claim 9, wherein said first foldable panel further includes an anchor section adjacent to said center section, said anchor section including a pair of end flaps engageable with a medical device contained in a blister tray.

11. The package of Claim 10, further comprising a second foldable panel connected to said first foldable panel, said second foldable panel including a third fold line and a fourth fold line positioned on one side of said third fold line, a holding tab positioned on an opposite side of said third fold line, and a sub-panel positioned between said third fold line and said fourth fold line.

12. The package of Claim 11, wherein said first foldable panel has a first width and said second foldable panel has a second width, said first width being larger than said second width.
